Project LIFE–Nature (ElClimA) “Conservation measures to assist the adaptation of *Falco eleonora* to climate change”

The project aims to:

facilitate Eleonora’s falcon adaptation to the climate change by the implementation of a series of conservation actions that will improve:

➤ *The breeding performance of the species*

- reducing egg losses and mortality rates of nestlings, by controlling invasive species,
- improving the quality and the availability of nesting sites, by constructing artificial nests,
- improving prey availability and quality.

© MCC

➤ *The species’ conservation status at its foraging areas*

- identifying foraging areas utilized by the species,
- assessing the quality and impact of land use in these areas,
- networking among experts to help design and promote efficient mitigation measures.
